(a)
probability density
hiatus τ (steps)
$\tau^{-3/2}$
Gaussian
Laplace
stable $\alpha = 1.5$
stable $\alpha = 0.8$
fBm $H = 0.3$
fBm $H = 0.7$
(b)
hiatuses $> \ell$ per unit thickness
ℓ/t_c
simulation
Lévy measure, exact
(c)
longest hiatus $/t_c$
record duration T/t_c
simulation, quartiles
simulation, median
exact median
$4[\ln \hat{T} - \frac{3}{2}\ln\ln \hat{T}]$
